EURUSD: The move downwards seems to have resumed with our first price target of 1.1060 achieved. The next target is 1.0842. As a reminder, we're now in week #70 where we have never closed outside the 1.15-1.06 price range.

GBPUSD: This is what we wrote last week: *"As any broken market we've seen in the past struggling to find its equilibrium, we continue to see large price swings making it quite difficult to pick appropriate risk/reward trades. The trends and the weight of the evidence continue to point to substantial further weakness."*

USDJPY (n.b.: futures are quoted inversely to cash so when futures are rising the JPY is rising in value): This market is officially in confusion with too many conflicting signals. Most of the time, the longer term trend eventually asserts itself. We're on the sidelines until we get further clarity.

Crude WTI: Crude oil is probably entering its next bearish phase. The weight of the evidence is overwhelmingly in favor of weaker prices and perhaps an acceleration to the downside. Keep an eye on our 43.70 price target. A couple or so closes at or below that level will be another nail in the coffin. For those of you with longer memories, this market has a similar set-up to October 2015 when we warned about a price collapse. We're not saying that it will happen again BUT the evidence is mounting, thus increasing the probabilities.

S&P500: They say that the end of bull markets are usually characterized by buying frenzies, investor exuberance and all sorts of manic behaviour. If this is so, then this market has a very long way to go. We're certainly no experts in investor sentiment but looking at our trend indicators and weight of the evidence, we're very clear that the path of least resistance remains towards higher prices.

Gold: Last week we wrote: *"This market pauses for a nice breath presenting us with a good opportunity to enter long."* Not much has changed.

30-year bond: Bonds and gold are in lockstep. We're sure that there must be some "logical" explanation for this but we care very little for it. The reason we care little for logic in markets is that logic is a bad real-time money manager. The uptrend is intact and the weight of the evidence still points to higher prices.

How to read the table

Market futures unless indicated (Contract month)	Weekly Closing Price (1)	Change from last week (2)	Short-term trend (3)	Long-term trend (4)	Short-term price target (5)	Long-term price target (6)	Position Bias (7)
EURUSD (Dec '15)	1.1241	+0.0038	→↑	→↓	1.1713, 1.1748, 1.1870	1.1713	-

- Weekly price close
- Change from last week
- Short-term trend
- Long-term trend
- Short-term price target
- Long-term price target
- This is not a recommendation to enter the market per se but rather a bias on the direction from which to enter if an appropriate trading/investment opportunity presents itself
 - When "long", we're thinking of entering from the long side
 - When "short", we're thinking of entering from the short side or at the very least we're out
 - When "-", then we're not thinking about this market

So looking at the above table we know that:

- EURUSD Dec 2015 future closed at 1.1241
- On a closing basis, EURUSD rallied 0.0038
- The short-term trend is side-up
- The long-term trend is side-down
- We have short-term price targets of 1.1713, 1.1748 and 1.1870
- We have long-term price targets of 1.1713
- We have no bias as to where this market is heading, hence we're not thinking about entering

How to benefit from the analysis

"The presumed positive relationship between risk and return is predicated on the assumption that there's no such thing as investment skill and value-added decision making. If markets are efficient and there's no skill, it's reasonable to believe that higher returns can be attained only through the bearing of increased risk. But if outstanding skill is present, there's no reason to think that it can't be used to create portfolios with low risk and high return potential." Howard Marks, Oaktree Capital Management L.P.

Making money in the markets is not easy and requires second-level thinking. The main purpose of the analysis is to help one's decision process by being properly positioned in a market to avoid a big hit. "Staying in the game" is an absolute prerequisite for long term success and it's mostly overlooked by the public. Results will ultimately depend on execution, managing one's risk and emotions and the use of common sense.

What it does

The analysis is based on a quantitative method. The sole purpose is to detect the trend – or lack of it – and to produce price targets (PT). What you read in the table is purely a quantitative output. However, the decision to trade/invest also depends on qualitative inputs, which is not the purpose of this write-up. At all times, remember that a market is in either of the 3 states below:

- Uptrend
- Downtrend
- Undecided

Basic principles

- In an uptrend we're either out, long or looking to enter from the long side
- In a downtrend we're either out, short or looking to enter from the short side
- When there is no trend, we simply wait until the market tells us where it wants to go

When a market is in trend, then we get signals that produce PT. In an uptrend, the PT is higher than current price. In a downtrend, lower. The PT is in effect until achieved or negated.
